Inhibiting expression of target gene, useful e.g. for inhibiting

```
Inhibiting expression of target genes, useful e.g. for treating tumors, by introducing into cells two double-stranded RNAs that are complementary to the target.
                                                                         The invention relates to inhibiting expression of a target gene (1) in a cell by introducing an inhibitory RNA (dsRNA1) having a double-stranded structure of at most 49 consecutive bases. At least part of one strand (as1) of dsRNA1 is complementary to (1) and at least part of one strand has an overhang of 1-4 nucleotides. The method is used to inhibit the expression of a wide range of genes, e.g. oncogenes, cytokine genes etc. in humans, also genes in Plasmodium or in viruses or viroids that are pathogenic for humans, animals or plants. Introducing an overhang into both in vivo and in vitro and also increases stability and thus the effective concentration inside the cell. The present sequence is that of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 HisSerGlnMetAlaValHisLysLeuAlaLysSerIleProLeuArgArgGlnValThr 20

                                                                                                                                                                                                                                                                                                                                                           CACAGCCAGATGGCTGTGCACAAGCTGGCCAAGAGCATCCCTCTGCGCAGACAGGTAACA 1284
                  The invention relates to inhibiting expression of a target gene in a cell by incroducing at least two oligoribonuclectides (daRNAI and II), both with a double-stranded (ds) structured at most 49 sequential nucleotide pairs. At least part of one strand (S1, S2) of the ds structures in each of dsRNAI and II are complementary to regions in the target gene. The method uses antisense inhibition of gene expression using double stranded RNA inhibition (RNAI). The method is particularly used to treat tumours or infections, especially by Plasmodium or viruses/viroids (pathogenic on humans, animals or plants). The method provides more effective inhibition of expression than known methods using a single dsRNA, even at very low concentrations. When dsRNA has at least one unpaired nucleotide at the concentration of and thus effective concentration in the cell) is improved and efficiency can be increased further by precreating the cells with interferon. The present sequence is that of a target DNA of the invention
                                                                                                                                                                                                                                                                                                                                               20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inhibiting expression of target genes, e.g. oncogenes, in cells, by introduction of complementary double-stranded oligoribonucleotide, after treating the cell with interferon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Oligoribonucleotide; interferon; oncogene; cytokine; Id; developmental;

target gene by introducing into the cell that contains the target gene at least one oligoribonucleotide (dsRMI) that has a double-stranded (ds) structure of not more than 49 consecutive nucleotides (nt), where at least a segment of one strand of the ds structure is complementary with the target gene and the cells are treated with interferon before protein genes, particularly oncogens, cytokine genes, id (not defined) potein genes, particularly oncogens, cytokine genes, id (not defined) potein genes, particularly oncogens, cytokine genes expressed in pathogenic organisms (particularly plants). Treating the cells with interferor greatly increases the extent to which dsRNA on inhibit expression of the target genes, and the effect is even greater when dsRNA are modified to increase their stability, ABX09936-ABX10075 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ģ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, HIV, HCV, gene expression, oligoribonucleotide, tumour, pathogen,

most 49 sequential nucleotide pairs, with at least part of one strand complementary. With the target game and has at least one on a single-stranded segment of 1-4 nt. The method provides oligoribonucleotides for antisense inhibition of gene expression useful e.g. for treating tumours but the oligoribonucleotides may also be directed against genes present in pathogens (e.g. plasmodium or viruses/viroids, pathogenic on humans, animals or plants) or against cytokine, Id, developmental or prion genes. The method provides more effective inhibition of gene expression than use of known oligonucleotides, probably because the unpaired overhang increases stability and thus intracellular concentration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1225 CACAGCCAGATGGCTGTGCACAAGGCTGGCCAAGAGCATCCCTCTGCGCAGACAGGTAACA 1284
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes an antisense nucleic acid compound (I), used as a diagnostic and therapeutic agent. (I) comprises: (1) an antisense nucleic acid compound (II) having the base sequence TTGGTTT; (ii) an antisense nucleic acid compound (III) having the above base sequence in which the base number is expressed by a base sequence between 10 and 60; and (iii) an antisense nucleic acid molecule (IV) comprising one of the 3 sequences given in ABA01686 to AB01688, all comprising of 20 nucleic acids, and that inhibit the expression of fibroblast growth factor receptor 1 (FGFR1). (I) is useful as a treating agent, a

compared (Ruta et al., Oncogene, 3: 9-15). A full length flg cDNA clone was obtd. by repeated rounds of PCR using 8 primers (AAQ23610-17), and was cloned into pMA30. NIH 3T3 cells were cotrarsfected with a 1:20 mixture of pSy2neo and an flg expression vector contg. the flg probe inserted into pMA30 immediately downstream of the SV40 promotor and contained into pMA30 immediately downstream of the SV40 promotor and contained for aFGP receptors, the best being clone Nfig26 which was used binding for aFGP receptors, the best being clone Nfig26 which was used for DNA sequencing. The sequence shown contains an apparent insertion case features) which disrupts the reading frame. This is restored, chowever, by a deletion downstream in the sequence. No reference is made by the authors to these discrepancies, which are therefore assumed to be compared an endomediate contains an apparent insertion contains an apparent in the sequence may be compourturistic pathogen to human cells. Such undesirable heparin-binding of growth factor mediated cellular responses or to inhibit the binding of an opportunistic pathogen to human cells. Such undesirable responses may be grown factor stimulated angiogene is and vascularisation of tumours, contenting protein may also be used for correcting drugs for treatment of such problems. See also AAQ21004.

New pyridylpyrimidine derivatives useful in the treatment or prevention of infectious disease e.g. Kuru syndrome and Creutzfeld-Jacob disease (CDD). P-PSDB; AAE34488

Disclosure; Page 61-62; 96pp; English.

The invention relates to novel pyridylpyrimidine derivatives and methods of detecting prion infections and/or prion disease in an individual or in cells. Cells intures and/or cell lysates. The method involves adding at least one monoclonal or polyclonal antibody, oligonuclectide or pyridylpyrimidine derivative to the sample or in cells, cell cultures and/or cell lysates and detecting the activity of at least one human cellular protein kinases (e.g., FGF-R1 (also known as flg, R1-1, P1L-2, b-FGFR), cell lysates and detecting the activity of at least one human cellular protein kinases (e.g., FGF-R1 (also known as flg, R1-1, P1L-2, b-FGFR), ce whown as CCK-2, DDR-2 or EDDR, EC number 2.7.1.112), Abl (also known as CDK1), PRX, human cellular protein phosphatases such as PTP-SL (also known as MCP83) and PTP-zeta, the cellular signal transduction conduction of prions in cells and in the manufacture of pharmaceutical production of prions in cells and in the manufacture of pharmaceutical composition for prophylaxis and/or treatment of infectious disease (e.g., composition wasting disease (CMD), bovine spongiform encephalopathy (TMB), creutifeldt-Jacob disease (CMD), bovine spongiform encephalopathy (TMB), variant CJD, Gerstmann-Straussler-Schennker syndrome (GSS), fatal familial insomnia (FFI), kuru and Alpers syndrome, especially BSE, CJD, contraction of the present sequence is human FGF-RI DNA used in the

                                                                                                                                                                                                                                                                                                                                                                               Composition useful for identifying modulators of fibroblast growth factor -mediated signaling for use in treating cancer, has ternary complex of FGF-receptor, FGF ligand and heparin agonist or antagonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to an isolated composition comprising a ternary complex of an Fibroblast Growth Factor (FGF) ligand polypeptide (ABR56163, ABR56163, an FGF receptor polypeptide (ABR56164) and a heparin agonist or antagonist, where the agonist or antagonist binds to the FGF receptor polypeptide to form the ternary complex. The composition is useful for identifying a compound that is an inhibitor of FGF receptor activity. FGF1 is also known as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 HisSerGlnMetAlaValHisLysLeuAlaLysSerIleProLeuArgArgGlnValThr

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antisense oligomers which hybridise to the human fibroblast growth factor receptor I pre-mRNA and inhibit FGFR1 expression are claimed. The oligomers pref. hybridise to the alpha-exon region and are useful for preventing growth of tumours, esp. glioma or glioblastoma cells. The present sequence is that of the FGFR1 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inhibiting growth of tumour cells - using an anti:sense oligomer for the human fibroblast growth factor receptor-1 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 HisSerGlnMetAlaValHisLysLeuAlaLysSerIleProLeuArgArgGlnValThr

The human basic fibroblast growth factor (b-FGF) receptor sequence was obtd. from a human placenta cDNA library in lambda gtll. The library was screened with two probes (AAQ24634,5) which were derived from the known FLG sequence (fms like gene). Positive clones were transformed into E. coli Y1090 strain, and recombinant phage were sequenced
                                                                                                                                                                                                                                                                                                                                                                                                                             Human b-FGF receptor gene - contains recombinant DNA, chromosome DNA or cDNA base sequence encoding polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, artery, endothelium, umbilical, vein, aorta, pulmonary artery, bronchial epithelium, prostate, muscle, lung fibroblast, osteoblast, tumour, microarray, genome mapping, antibiotic, antiviral, antifungal, gene expression, gene, ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence was obtd. from a clone isolated from a huma ubilical vein endothelial cDNA library and a human placenta cDNA library using a probe can the hflg cDNA sequence. Four types of positive clones were isolated, divided into two classes based on their restriction patterns: based on the hflg cDNA sequence. Four types of positive clones were constant in the sequence of bases 2857 - 3612 appears to be absent from the consequence of bases 2857 - 3612 appears to be absent from the specification, with the 3' terminal of bases 3613-3636 given as: specification, with the 3' terminal of bases is growth factor complete which can be used for tissue repair or developement and for neuron maintainance. The DNA and protein and antibodies prepd. from it can be used to treat diseases resulting from aberrant RGF expression and for elucidating the mechanism of FGF and identify ing agonists for the prevention of angiogenesis and control of tumours. farnesyl transferase inhibitor; gene expression;

```
Determining whether a patient will respond to treatment with a farnesyl transferase inhibitor, by analyzing the expression of gene that is differentially modulated in the presence of the inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; SEQ ID NO 98; 346pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score:
The invention relates to a gene expression profile comprising one or more genes (AB2348894-AB235692) and generated from a cell type. The cell type is a coronary artery endothelium, umbilical artery or vein endothelium, acric endothelium, dermal microvascular endothelium, pulmonary artery endothelium, mammary epithelium, prostate epithelium, mornelial epithelium, mammary epithelium, prostate epithelium, renal cortical epithelium, artery smooth muscle, menal dermal fibroblast, pulmonary artery smooth muscle, menal dermal fibroblast, pulmonary artery smooth muscle, cortic smooth muscle, merangial cells, coronary artery smooth muscle, cortic smooth muscle, merangial cells, coronary artery smooth muscle, cortic smooth muscle, ung fibroblast, cortic smooth muscle, lung fibroblast, cortic smooth muscle, ung fibroblast, cortic smooth muscle, ung fibroblast, cortic smooth muscle, ung fibroblast, cortic smooth muscle, ung fibroblast, cortic smooth muscle, ung fibroblast, cortic smooth muscle, ung fibroblast, cortic smooth muscle, ung fibroblast, cortic smooth muscle, ung fibroblast, cortic smooth muscle, ung fibroblast, cortic smooth muscle, ung fibroblast, cortic smooth muscle, ung fibroblast, cortic smooth muscle, ung fibroblast, cortic smooth muscle, ung fibroblast, cortic smooth muscle, ung fibroblast, cortic smooth muscle, ung fibroblast, cortic smooth muscle, und distinguishing dell cypes. The gene or a procein cortic phenotype of a cell and distinguishing cell types. The gene or a procein cortic and profile is useful in identifying disease pathologies involving alternation with respect to tumour type and stage, treatment methods, and prognosis. The gene or protein expression profile cortic and physical mapping of genomes, DNA sequencing, genetic or dentifications and in identifying promising antibiotics, antiviral or antiviral or antiviral or antiviral or antiviral or antiviral or antiviral or
                                                                                                                                                                                                                                                                                                                                              New gene expression profile generated from primary, endothelial, epithelial, and muscle cell types, useful for identifying disease pathologies involving alterations of gene expression, e.g. cancer

The invention relates to a method of determining whether a patient will respond to treatment with a farnesyl transferase inhibitor (FTI), by analyzing the expression of gene that is differentially modulated in the presence of an FTI. The method is useful for determining whether a patient will respond to treatment with a FTI such as (B) 6-[amino 4-chlorophenyl) (1-methyl-1H-imidazol-5-tyl)methyl]-4-(3-chlorophenyl) 1-methyl-2-(1H)quinolinone, monitoring the therapy of a patient, treating a patient with leukemia with FTI if the analysis indicates that the patient will respond. This sequence of FTI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 HisSerGlnMetAlaValHisLysLeuAlaLysSerIleProLeuArgArgGlnValThr 20

This is the nucleotide sequence of human fibroblast growth factor receptor 1 (FGFR1) cDNA. The FGRR1 gene is located on chromosome 8. A newly identified oncogene, SNF199-FGRR1 (see AAX87177), incorporates a CFRR1 tyrosine kinase domain fused through t (8,13) translocation to SNF198 a novel zinc finger gene of chromosome 13, and is associated with stem of the chromosome 13, and is associated with seem call letwisemia 4/ymphoma syndrome (SCLL) Molecular characterisation of the oncogene and the encoded oncoprotein (see AAY06456) provides the ability to identify patients with t (8;13) (p11;q11-12) syndrome prior to onset of mysociated on the demonstrate of mysolid leukaemia. The oncogene can be identified with primers and probes capable of hybridizing to ZNF198 or FGFR1 tyrosine kinase domain coding sequences. Cells containing ZNF198-FGFR1 can be located Attribodies that recognize this fusion juncture can also be used to deliver toxic substances to patients containing the ZNF198-FGFR1 protein. This is useful for treatment of SCLL. Antisense nucleotides and ribozymes targeted to ZNF198-FGFR1 nonceptine are useful for reducing expression or disrupting translation of the oncogene. Computational Analysis of Full-Length Mouse cDNAs Compared with

Human Genome Sequences Mamm. Genome. 12, 673-677 (2001)

Normalization and subtraction of cap-trapper-selected cDNAs to

prepare full-length cDNA libraries for rapid discovery of new

genes. Genome Res. 10 (10), 1617-1630 (2000)

RIKRN integrated sequence analysis (RISA) system--384-format

sequencing pipeline with 384 multicapillary sequencer. Genome Res.

10 (11), 1757-1771 (2000)

Computer-based methods for the mouse full-length cDNA

encyclopedia: real-time sequence clustering for construction of a

nonredundant cDNA library. Genome Res. 11 (2), 281-289 (2001)

cDNA library was prepared and sequenced in Mouse Genome

/note="Organ: nervous tumor; Vector: puc18; Site_1: Sma1; Site_2: Sma1, A min1. library was made by cloning products derived from ORESTES PCR (U.S. Letters Patent application No. 196,716 - Ludwig Institute for Cancer Research) profiles into the pUC18 vector. Reverse transcription of tissue mRNA and CDNA amplification were performed under low stringency conditions.
                                                                                                                                                                                                                                                                                                                                                                                                  Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

/note="Graga: Eye' Vector: pCWYSPORT6, Two different donor eyes (7-50 years old) yielded approximately 600 mg of dissected RPE/choroid tissue. This in turn yielded 340 ug of total RNA and 7 ug of mRNA. A directionally cloned cDNA library in the pCMYSPORT6 vector was constructed at Life Technologies (Rockville, ND; now part of Invitrogen Corp), essentially following the protocols of the SuperScript Plasmid System (Invitrogen Corp).
/thtp://www.invitrogen.com/>). The library code designation was cs. For this library cDNA inserts were cloned into the Not!/Mull sites of the vector. EST analysis was performed on the unamplified library at the NH Intramural Sequencing Center (NISC)."

Patent No. 5750371
GENERAL INFORMATION:
APPLICANT: SENOO, Masaharu
APPLICANT: SENOO, Masaharu
APPLICANT: WATANABE, Tatssuya
TITLE OF INVENTION: PROTEIN, DNA AND USE THEREOF
NUMBER OF SEQUENCES: 18
CORRESPONDENCE ADDRESS:
ADDRESSEE: DAVID G. CONLIN; DIKE, BRONSTEIN, ROBERTS &
ADDRESSEE: CUSHMAN
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
COMPUTER: IBM PC compatible
COMPUTER: IBM PC compatible
COMPUTER: IBM PC compatible
COMPUTER: IBM PC compatible
CONFUNE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/471,570
FILING DATE: 06-UN-1995
CLASSIFICATION DATA:
APPLICATION NUMBER: US/08/149,664
FILING DATE: 16-AUG-1991
